SailPoint Identity Security Cloud capability: Analytics

Securely connecting the right people to the right technology is incredibly complex; in fact, it's moved well beyond human capacity. The vast amounts of identity data systems produce makes it challenging to make sense of it all. It's also difficult to leverage raw data in a format consumable and actionable by your staff and administrators.

Identity Security Cloud Analytics can help. With a set of capabilities designed to take advantage of artificial intelligence and machine learning to help understand trends, spot anomalies and historical context, you can improve visibility into access patterns and enable better decision making. The following describes the components that comprise the overall set of capabilities.

Access Intelligence Center

The Access Intelligence Center is SailPoint's embedded business intelligence tool for the Identity Security Cloud solution. It can be used out-of-the-box or you can create and edit tailored dashboards for operational analysis and reporting. The tool helps you track the status of your identity program and security posture.

Activity Data for Certifications, Recommendations and access modeling

Activity data provides deeper context into entitlements and roles, providing insights into not only the popularity of an entitlement, but actual usage, enhancing approval decisions of and access to request recommendations.

BENEFITS

- ▶ Increase visibility into access patterns and history
- ▶ Accelerate discovery of potential risk
- ▶ Support audit accuracy and help meet compliance requirements
- ▶ Improve the efficiency of your identity security program with customized dashboards
- ▶ Develop key performance indicators to guide improvement of access analysis and investigation

Activity data in access modeling helps users intelligently create roles based on deeper insight into how often entitlements are used by groups, not just who has particular entitlements.

Access History

Track and analyze user access over time to provide an audit trail and complete visibility into access changes. Report on different points in time to answer questions like available roles and entitlements, users with multiple roles, or roles held by users at termination. Access history also helps you understand how access was granted (and removed) for better auditing.

Identity Outliers and Outlier Score

Identity Outliers quickly discovers identities with access that is significantly different from their peers. Use identity outlier scores to understand the level of risk each outlier poses and help standardize the measurement of access anomalies across the organization. Configurable to trigger an automated workflow if the outlier score exceeds preset thresholds, and understand how the score was calculated, providing in-depth contextual insights.

About SailPoint

SailPoint is a leading provider of identity security for the modern enterprise. Enterprise security starts and ends with identities and their access, yet the ability to manage and secure identities today has moved well beyond human capacity. Using a foundation of artificial intelligence and machine learning, the SailPoint Identity Security Platform delivers the right level of access to the right identities and resources at the right time—matching the scale, velocity, and environmental needs of today's cloud-oriented enterprise. Our intelligent, autonomous, and integrated solutions put identity security at the core of digital business operations, enabling even the most complex organizations across the globe to build a security foundation capable of defending against today's most pressing threats.
